About Us

Green Safe Products is a Detroit-based business that was founded over 10 years ago which provides eco-friendly alternatives to oil-based disposable products. Our products are made from renewable resources such as corn, sugarcane, and biomass. With our efficient, biodegradable restaurant supplies, service industry owners can help lead their own communities in a green initiative. We pride ourselves in our ability to offer a wide range of environmentally responsible products at competitive prices.

Frequently Asked
Questions

20

INFORMATION

What is it made from?

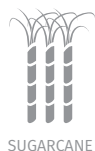

PLA or "corn plastic" is a biopolymer made from polylactide (PLA) that can be derived from starchy plants like corn, potatoes, tapioca, sugarcane, and soy protein. These biopolymers perform like plastic, but are made from annually renewable resources such as corn.

FREEZER

MICROWAVE

Bagasse is made from sugarcane. Rather than throwing away or burning used sugarcane stalks, the pulp is made into a paper-like substance called bagasse which is then formed into a wide variety of products like containers, plates, and bowls.

FREEZER

MICROWAVE

SFI certified paperboard feels and performs like traditional products, without petrochemicals. The Sustainable Forestry Initiative (SFI) is a nonprofit organization committed to promoting sustainable forest management. The standard sets guidelines and requirements for paper merchants and manufacturers of forest products to ensure that paper goods are being processed and sourced using sustainable practices.

FREEZER

MICROWAVE

Hot or Cold temperatures?

We recommend that any Ingeo (PLA) containers be stored at temperatures less than 105°F (40°C). Remember to keep these products out of direct sunlight and in a cool, dry place. PLA can also become brittle when frozen, so we don't recommend putting these products in the freezer.

Designed to withstand boiling water and limited microwave exposure. Although many of these products are microwave safe some items such as our hot cups, soup cups and certain containers are not designed for the extreme heat of the microwave. Microwaves will cause them to warp, leak or even catch on fire. Check product label before use.

The majority of our products excluding PLA items are designed for either hot or cold food applications. Bagasse and Paperboard do well with hot food items but you will notice that many of their matching lids and accessories are made from PET or plastic. This is due to PLA's inability to withstand heat.

Compostable?

Although the majority of our products are compostable this symbol clarifies that it's a BPI certified compostable item. The Biodegradable Products Institute (BPI) is a multi-stakeholder association of key individuals and groups from government, industry and academia, which promotes the use, and recycling of biodegradable polymeric materials (via composting).

Defined

A mixture of decayed or decaying organic matter used to fertilize soil. Compost is usually made by gathering plant material, such as leaves, grass clippings, and vegetable peels, into a pile or bin and letting it decompose as a result of the action of aerobic bacteria, fungi, and other organisms.

Where do I compost?

We recommend disposing of our products in a commercial compost facility where they can be broken down, turned into compost and then returned to the soil. Commercial compost facilities are expanding around the country and there may be one in your area. To find a compost facility near you, please visit the US EPA website.

Customizable?

Do you want to personalize your product? If you see this symbol next to an item we can do that for you! We use soy-based, UV inks. Must meet minimum order quantities of 50,000/size/design.

Our Process

- Send us your artwork and/or layout.
- We return an electronic production proof for your approval.
- With your approval, production begins.

What to Send Us

- Vector-based files to print. Acceptable file types: .ai, .eps, or .pdf as long as they aren't flattened. All files need to be outlined and vector-based.
- All type needs to be outlined, so convert fonts to paths. Text becomes a vector shape and will look no different than its original state.
- Submit 300dpi photo files at full project size or larger.

Identifying Color

When should you use Spot vs. 4-Color Process/CMYK?

- If your job uses just a few colors (three or less) - use **Spot** color.

For example:

PMS 072

PMS 382

PMS 129

- If your job uses more than three colors or if it has shadows, color gradations or includes a photo - use a **CMYK** build.

The build colors are cyan, magenta, yellow and black:

* W A S A R A

WASARA tableware is a gorgeous alternative to everyday paper tableware. This highly sustainable product is 100% tree-free, made from sugar cane, bamboo, and reed pulp. Easily compostable and certified to break down into soil, even in home composting systems, these durable tableware pieces are perfect single-use items.

The WASARA line is a collection of 18 durable pieces that can stand up to sauces and hot liquids and look great doing it. Their sculptural shape is pleasing to hold and adds to their allure.

Wasara

Why should I use compostable products?

Paper and textile products are biodegradable, but traditional plastics made from petroleum bases are not. Consumer packaging and disposable eating products made of new biodegradable plastics from corn and other plant bases have numerous environmental and efficiency advantages over nonbiodegradable products.

Fuel Efficiency

Manufacturing of polylactic acid (PLA) saves oil. Biodegradable plastic production takes 65 percent less energy than petroleum-based plastics, making biodegradable plastics the top energy-efficient choice. Biodegradable plastic products are made from renewable resources like corn, sugar cane and potato starch instead of oil. 200,000 barrels of oil a day are used in the United States alone in the manufacture of plastic packaging.

Less Pollution

Manufacturing biodegradable plastic products produces less pollution. Because the products can break back down into nontoxic components, they don't cause dangerous chemical leachate that can poison water or pollute the air. Biodegradable plastic products produce 68 percent less greenhouse gases than petroleum-based plastic products.

Compostability

Composting biodegradable plastics along with traditional biodegradable paper products and yard, food and agricultural wastes can turn this trash into rich humic material, which can improve water and nutrient retention and help grow healthier plants with less need for chemical fertilizers and pesticides.

How long does it take for compostable products to breakdown?

Compostable products break down in a commercial compost facility in fewer than 180 days. Most biodegradable products break down in as little as 45-60 days, depending on the material type.

[Eco-Products \(www.ecoproducts.com\)](http://www.ecoproducts.com)

Can I put your compostable products into my backyard compost?

We recommend disposing of PLA products in a commercial compost facility where they can be broken down, turned into compost and then returned to the soil. Home composting typically does not create the consistent composting conditions needed for our products, but commercial facilities can manage just fine.

[Eco-Products \(www.ecoproducts.com\)](http://www.ecoproducts.com)

What is Biodegradable?

"Biodegradable" means that an object is capable of disintegrating by biological means. Technically, these items could be composed of almost any material since with enough time microorganisms can decompose almost anything. For example, aluminum cans will biodegrade in the ocean in about 200 years and hard plastic bottle caps will biodegrade in about 400 years.

[World Centric \(www.worldcentric.org\)](http://www.worldcentric.org)

Do compostable products breakdown in a landfill?

Compostable items are designed to be composted in a compost heap only. Composting is a very specific process which does not occur in landfills. Microorganisms, carbon, water, oxygen and nitrogen are all essential parts of the compost process and these factors need to be present in the right circumstances (such as in a compost pile) for composting to occur. If compostable products are placed in an open landfill or dump where oxygen is available, they will decompose at a rate similar to other biodegradable materials in the same setting.

[Eco-Products \(www.ecoproducts.com\)](http://www.ecoproducts.com)

What is PLA?

PLA (polylactic acid) is a bio-based plastic derived from renewable resources such as corn starch, tapioca roots, or sugarcane.

[World Centric \(www.worldcentric.org\)](http://www.worldcentric.org)

What is NatureWorks Ingeo?

Ingeo™ is a brand of PLA. PLA or "corn plastic" is a biopolymer made from polylactic acid (PLA) that can be derived from starchy plants like corn, potatoes, tapioca, sugarcane, and soy protein. In the U.S., PLA is typically made from corn kernels that are milled and processed to extract the starch which is then converted into plastic.

[Eco-Products \(www.ecoproducts.com\)](http://www.ecoproducts.com)

What is bagasse/sugarcane fiber?

Bagasse/sugarcane fiber is a byproduct of making sugar. When sugarcane stalks are harvested, they're pressed to release their juices that get processed into sugar. Then, rather than burning or throwing the used sugarcane stalks away, the fibrous pulp is made into a paper-like substance called bagasse which is then formed into a wide variety of products like containers, plates, and bowls.
